# 1 | Introduction

JavaCraft is a a multifaceted text-based Java game inspired by Minecraft. The game is a relatively complex Java program that brings over 35 functions to create a diverse gameplay experience. This project is an academic exercise in computer science, logical thinking, and collaboration. Working in teams of four, we used our creativity, analytical skills, and technical skills to analyse and expand upon the existing JavaCraft game.

# 2 | JavaCraft's Workflow

In order to fully understand the mechanism of the game, a flowchart of the entire game is provided below. The flowchart is accompanied by pseudocode.

Insert flowchart of game Insert pseudocode for game

# 3 | Functionality Exploration

This section describes several functions found in the JavaCraft.java file. Out of the functions, there are fifteen who have a flowchart and pseudocode.

 $\textbf{Table 3.1:} \ \ \textbf{A} \ \textbf{table that describes functions used in javacraft}$ 

No.	Function Name	Description
1	void generateWorld	assigns integer to every tile of the world
2	void initGame	creates world with width worldWidth and height worldHeight
3	void main	main function
4	void startGame	starts the game
5	void movePlayer	moves player horizontally or vertically
6	void mineBlock	mines block player is on if block is not air
7	String getBlockSymbol	returns symbol of blockType
8	void resetWorld	clears the world and sets player position in middl
9	void generateEmptyWorld	generates an empty world
10	void clearScreen	clears terminal
11	void lookAround	prints out adjacent squares to player
12	void fillInventory	completely fills up inventory of player
13	void displayLegend	displays a legend of what each tile represents
14	void displayWorld	prints out all tiles of the world
15	void displayInventory	prints out obtained items & crafted items
16	void loadGame	loads the game from file fileName
17	void saveGame	saves the game in file fileName
18	void interactWithWorld	interacts with item player is standing on
19	void addCraftedItem	adds item craftedItem to array craftedItems
20	void removeItemsFromInventory	removes item item count times from inventory
21	boolean inventoryContains	returns boolean of whether item is in inventory
22	void placeBlock	places block blockType at player position
23	void displayCraftingRecipes	prints out available crafting recipes
24	void craftItem	crafts an item based on argument recipe
25	void craftIronIngot	crafts an iron ingot
26	void craftStick	crafts a stick
27	void waitForEnter	waits for operator to press Enter
28	String getBlockTypeFromCraftedItem	returns integer of craftedItem
29	String getCraftedItemFromBlockType	returns integer of blockType
30	String getBlockName	returns name of blockType
31	String getBlockColor	returns color of blockType
32	String getCraftedItemName	returns name of craftedItem
33	String getCraftedItemColor	returns color of craftedItem
34	char getBlockChar	returns char of blockType
35	void craftWoodenPlanks	crafts wooden planks
36	void getCountryAndQuoteFromServer	makes HTTP request and writes data to server and prints country and quote

# 4 | Finite State Automata (FSA) Design

Secret Door Logic Analysis: Describe the secret doors functionality  $\, \bullet \,$  FSA Illustration and Description: Attach FSA diagram

### 5 | Git Collaboration & Version Control

The link to the JavaCraft branch can be found here: https://gitlab.maastrichtuniversity.nl/bcs1110/javacraft/-/tree/group11

All the files of the project can be found in the repository.

Everything was done on one branch called group11. There were no conflicts during the process.

#### 6 | Team Overview

Below describes what each team member did on the project:

#### 6.1 | Long Luong

Project leader

LaTeX Document owner and composer

Created 1 flowchart with pseudocode:

1. getCountryAndQuoteFromServer

Finalised the Function Exploration part

Helped others with git issues

Refined some pseudocode that others have made

#### 6.2 | Élisa Donéa

Designed FSA for secret door with Chris Initiated with the Function Exploration Create 5 flowcharts with pseudocode:

- 1. fillInventory
- 2. generateEmptyWorld
- 3. generateWorld
- 4. initGame
- 5. lookAround

#### 6.3 | Chris Munteanu

Designed FSA for secret door with Élisa and created description of FSA Create 5 flowcharts with pseudocode:

- 1. displayInventory
- 2. getBlockName
- 3. loadGame
- 4. removeItemsFromInventory
- 5. saveGame

#### 6.4 | Alexia Raportaru

Create 5 flowcharts with pseudocode:

- 1. placeBlock
- 2. craftItem
- 3. interactWithWorld
- 4. mineBlock
- 5. movePlayer

Created an impressive flowchart of the entire game along with its pseudocode explanation

#### 6.5 | Explanation

When we first met up with each other we were with the three of us. During the first week we got to know each other. Long proposed to be the document manager because he knows how to use LaTeX. He also created a (now deprecated) GitLab repository found at https://gitlab.maastrichtuniversity.nl/I6359380/test-project/. During the second week Alexia joined the group. We met up with each other and we divided the roles. We had to create at least 16 flowcharts alongside with pseudocode. Long mentioned that most of the functions are vey easy to understand, and since he wanted a difficult one he proposed to do the function getCountryAndQuoteFromServer and he proposed the other three group members to do 5 flowcharts with their respective pseudocode. Everybody agreed and thinks it is a good idea.

In week 3 and later Élisa and Chris decided to work on the FSA together. Everybody in the group was new to Git except Long, so he helped out everyone set-up the Git environment and he explained to

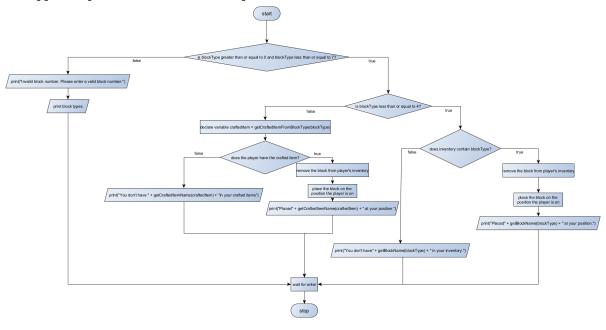

everyone how it works. In the meantime, Alexia worked on the flowchart and the pseudocode of the entire game JavaCraft. Later, Long found out he made a mistake and that we had to create a branch on the repository https://gitlab.maastrichtuniversity.nl/bcs1110/javacraft/ so he informed everybody about the mistake and that we all had to migrate to the correct branch.
